Nuclear Starburst Disks

ACTIVE GALACTIC NUCLEI

Fritz Ali Agildere

April 29, 2026

Description

- $10^{42-43} \text{ erg s}^{-1}$ Peak Luminosities
- Soft X-Ray Spectrum Without Hard Coronal X-Rays
- Hours/Days Recurrence Times
- $kT \sim 50 - 80 \text{ eV}$ Accretion Disk Quiescent Emission
- $kT \sim 100 - 250 \text{ eV}$ Thermal Like Flares
- Expanding Emitting Region Temperature Hysteresis
- Sometimes Regular Double Pattern
- $10^{5.5-6.5} M_{\odot}$ Mass Systems

Characteristics

- Strong TDE/CLAGN Connection
- Post Starburst Galaxy Overrepresentation
- Missing Optical Broad Lines (No BLR)
- Narrow Lines Present (Past AGN Like Activity)
- Extended Emission Line Regions (Short Lived SMBH Flare Ionization)

Mechanisms

■ Disk Instabilities

- Accretion Flow Ring Oscillation (Stable/Unstable Mode Cooling/Heating)
- Warped Accretion Disks (Below Viscous Timescale Discrete Ring Breakup)

■ Orbiter Interactions

- Repeating Partial Tidal Disruptions (pTDEs)
- Roche Lobe Overflow ($\epsilon \ll 1$ MS Star)
- Extreme Mass Ratio Inspiral (SMO/BH EMRI)

Column Density

Modelling

Angular Obscuring

Modelling

Outlook

- Static Torus / Puffy Starburst Disk Separation (JWST & ALMA)
-
- Galactic Nuclei Stellar Dynamics
- Detailed Accretion Disk Structure
- Precision Cosmology Measurements
