Quasi Periodic Eruptions

ACTIVE GALACTIC NUCLEI

Fritz Ali Agildere

April 8, 2026

Characteristics

- $10^{42-43} \text{ erg s}^{-1}$ Peak Luminosities
- Soft X-Ray Spectrum Without Hard Coronal X-Rays
- Hours/Days Recurrence Times
- $kT \sim 50 - 80 \text{ eV}$ Accretion Disk Quiescent Emission
- $kT \sim 100 - 250 \text{ eV}$ Thermal Like Flares
- Expanding Emitting Region Temperature Hysteresis
- Sometimes Regular Double Pattern
- $10^{5.5-6.5} M_{\odot}$ Mass Systems

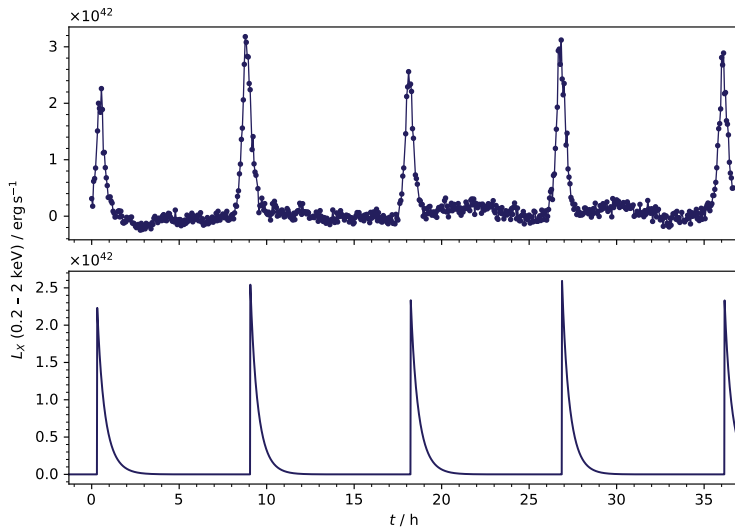

Characteristics

- Strong TDE/CLAGN Connection
- Post Starburst Galaxy Overrepresentation
- Missing Optical Broad Lines (No BLR)
- Narrow Lines Present (Past AGN Like Activity)
- Extended Emission Line Regions (Short Lived SMBH Flare)

Models

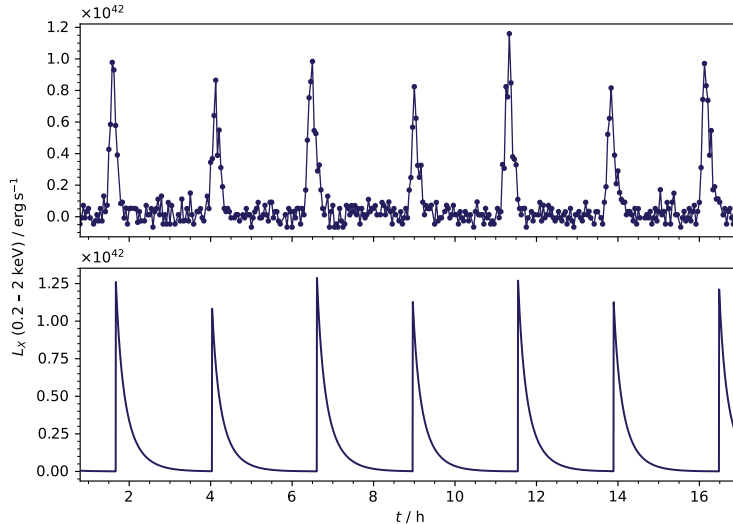

- Disk Instabilities
 - Accretion Flow Ring Oscillation (Stable/Unstable Modes)
 - Warped Accretion Disks (Discrete Ring Breakup)
- Orbiter Interactions
 - Repeating Partial Tidal Disruptions (pTDEs)
 - Roche Lobe Overflow ($\epsilon \ll 1$ MS Star)
 - Extreme Mass Ratio Inspiral (SMO/BH EMRI)

Examples

Source: eRO-QPE2

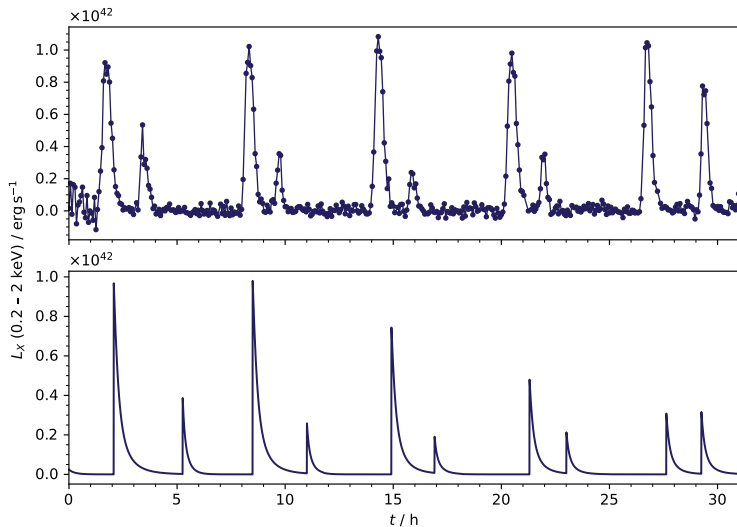

Examples

Source: eRO-QPE1

Examples

Source: RX-J1302

Examples

Outlook

- Longer Term XMM-Newton / NICER Observations (Exclude Models)
- LISA Gravitational Wave Detection
- Galactic Nuclei Stellar Dynamics
- Detailed Accretion Disk Structure
- Precision Cosmology Measurements

Thank You!
